

the 1990s, the number of people in the world who are under 15 years of age is expected to increase from 1.1 billion to 1.5 billion.

As the world's population grows, the demand for food and other resources will increase. This will put pressure on the environment and on the world's food supply. It is important that we find ways to meet this demand without harming the environment or the world's food supply.

One way to meet this demand is to increase the efficiency of our food production. This can be done by using better farming techniques, such as crop rotation and the use of fertilizers. It can also be done by using better irrigation techniques, such as drip irrigation.

Another way to meet this demand is to reduce the amount of food that is wasted. This can be done by using food more efficiently, such as by using leftovers and by composting food waste. It can also be done by reducing the amount of food that is produced in the first place.

Finally, we can meet this demand by finding new sources of food. This can be done by using alternative sources of food, such as insects and algae. It can also be done by using genetic engineering to create new food crops.

There are many ways to meet the world's growing demand for food and other resources. It is important that we find ways to do this without harming the environment or the world's food supply.
